

Mission Statement

The Hannam Fertility Centre strives to meet each patient's needs through a personalized and effective course of treatment. In addition to offering the highest standard of care through cutting-edge technology and a state-of-the-art facility, we aim to provide an intimate and educational environment for our patients.

Vision and Values

Vision

To become the first choice in fertility treatment of women and men aspiring to create families.

Values

Each member of our team is committed to providing professional and innovative services that give you the greatest chance of building the family you want. Additionally, we aim to enhance the patient experience by focusing on your overall health and emotional wellbeing. We believe that patient interaction, clear communication and a compassionate approach are integral to our success—and yours.

Environment

For many people engaging the services of a fertility specialist, success rates will be the most important factor in the decision-making process. We are enormously proud of our high pregnancy rates. But we also feel that environment is important—both for your fertility success and your overall happiness during what is often an emotional and trying time. Our staff is caring and compassionate, and we are committed to maintaining an open dialogue with you about your care. Our office is warm and professional, and has been designed with your comfort and convenience in mind. We are open seven days a week.

Hannam

fertility centre

Led by fertility specialist Dr. Thomas Hannam, the Hannam Fertility Centre comprises a small team of physicians, nurses, technicians and support staff devoted to the pursuit of creating families. Our high staff-to-client ratio reflects our commitment to treating every patient as an individual, and we are proud of our consistently high pregnancy rates.

Hannam Fertility Centre provides a full range of fertility services, from educational visits and cycle monitoring to the most advanced diagnostic and therapeutic techniques available in Canada, including IVF, ICSI, pre-implantation genetic diagnosis, and egg freezing.

Services

We offer a wide range of services and treatment protocols, from educational office visits to minimally invasive procedures such as cycle monitoring and intraturine inseminations. When necessary, we also provide the most innovative diagnostic and therapeutic techniques available in Canada, including IVF, ICSI, pre-implantation genetic diagnosis, and egg freezing.

At HFC, we offer two types of female fertility testing. Cycle Monitoring is the most common, and the first step for women who have attempted to conceive naturally and are eager to expand their family now. The second type, which we call simply Fertility Check, is a new program we have developed in response to enquiries about future fertility potential from single women and others who are weighing their pregnancy and parenthood options.
